```
Increasing microbial production of amino acids, especially lysine - by improving export carrier activity or corresponding gene expression, also new export and regulatory genes from Corynebacterium.
                                                                                                                                                                                                                                                                                                                                                             LysG, LysE; ORF3; lysine transport; regulatory protein; export protein; Microbial production; amino acid; animal feed additive; ds.

This DNA, isolated from Corynebacterium glutamicum, contains the LysG, LysE and ORPS genes. LysG and LysE encode a lysine transport regulatory protein and an export protein, respectively. Microbial production of amino acids (A) is improved by increasing the export-carrier activity and/or the export gene expression in a microorganism that produces (A). The method is specifically used to increase production of lysine, used as an animal feed additive. Other (A) are variously useful as pharmaceuticals, condiments and intermediates for fine chemicals. This method increases the amount of (A) are oracled into the culture medium. Export of (A) has been found to depend on a single gene. NB. This sequence has been created from the information given in table 2 of the specification.	Ouery Match Best Local Similarity 100.0%; Score 2374; DB 2; Length 2374; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for producing L-arginine in a microorganism (e.g. coxymeform bacteria) that has L-arginine producing ability and has been modified for enhanced expression of the lysE gene. The microorganism is also modified so that an arginine repressor (argR) does not function normally. The method of the invention is useful for the enhanced production of L-arginine which is useful in liver function promoting agents, amino acid infusion and comprehensive amino acid pharmaceuticals. The present sequence represents a DNA fragment containing Corynebacterium glutamicum Lyse and LysE genes. Note: The present sequence is given as SEQ ID No.24 in the Sequence Listing but is referred to as SEQ ID No.25 in the rest of the specification.

Ŋ

The present invention provides a number of nucleotide and protein

CC sequences from the Coryneform bacterium Corynebacterium glutamicum. These

are useful for identifying the mutation point of a gene derived from a

cm nutant of coryneform bacterium, measuring expression amount and analysing

CC coryneform bacterium, measuring expression amount and analysing

CC coryneform bacterium, and identifying a homologue of a gene derived from

CC coryneform bacterium, coryneform bacteria are useful for producing amino

CC coryneform bacterium, coryneform bacteria are useful for producing amino

CC acids, nucleic acids, vitamins, saccharides and organic acids amino

CC acids, nucleic acids, vitamins, saccharides and organic acid described

CI nelectronlarly L-lysine. The present sequence is a nucleic acid described

CI nelectronic format directly from the Buropean Patent Office

CC patent did not form part of the printed specification, but was obtained

CC in electronic format directly from the Buropean Patent Office

AAF11753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP mucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes
                                                                                                                                                                                                                                                                         Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and

The present invention relates to the isolation of novel Corynebacterium glutamicum genes encoding metabolic pathway (MP) proteins (AAU71863-AAU71922). The metabolic pathway proteins of the invention include enzymes involved in the lyshim actionic biosynthetic pathways. The polymucleotide sequences of the invention can be used for the large-scale production and/or modulation of expression of fine chemicals such as lysine and methionine. The sequences of the invention may be used to identify C. glutamicum and related organisms e.g. C. diphtheriae in a subject to detect diphtheria. AAS96073-AAS96132 represent C. glutamicum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acids encoding metabolic pathway proteins from Corynebacterium glutamicum, useful for producing methionine and lysine in Corynebacterim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genes encoding the novel metabolic pathway proteins of the invention

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, Coryneform bacterium and identifying a homologue of a gene derived from acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1421 ATGAACCCCATTCAACTGGACACTTTGCTCTCAATCATTGATGAAGGCAGCTTCGAAGGC 1480

AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80311. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, purina and pyrimidine bases, nucleosides, nucleosides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids from Corynebacterium glutamicum encoding metabolic pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and

The present invention relates to the isolation of novel Corynebacterium glutamicum genes encoding metabolic pathway (MP) proteins (AAU71863-AAU71922). The metabolic pathway proteins of the invention include enzymes involved in the lysine and methionine biosynthetic pathways. The polymucleotide sequences of the invention can be used for the large-scale production and/or modulation of expression of fine chemicals such as lysine and methionine. The sequences of the invention may be used to identify C. glutamicum and related organisms e.g. C. diphtheriae in a subject to detect diphtheria. AAS96073-AAS96132 represent C. glutamicum genes encoding the novel metabolic pathway proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TGCGGTCCGATGGACAGTAAAAGACTGGCCCCCAAAAGCAGACCTGTAATGAAGATTTCC 1348
